Executive Summary

The Base Case forecast shows continued business growth through FY2027, while profitability and cash generation improve materially during the second half of the forecast period. Ending ARR increases from €10.7m at 2025 year-end to €13.6m in FY2026 and €17.5m in FY2027, representing annual growth of 26.8% and 29.1% respectively. Growth is supported by continued customer acquisition and ARPU expansion, while gross customer churn improves from 2.0% per month in FY2026 to 1.8% in FY2027.

Despite strong top-line growth, continued investment in headcount and operating capacity keeps the business EBITDA-negative throughout FY2026 and most of FY2027. EBITDA improves from €(0.9)m in FY2026 at a (7.4%) EBITDA Margin to €(0.4)m in FY2027 at a (2.9%) EBITDA Margin. Monthly EBITDA turns positive in Q4 FY2027, reaching approximately €30k in December. Gross margin remains resilient at approximately 85%, indicating that the path toward profitability is primarily dependent on operating leverage rather than gross-margin expansion. The Rule of 40 improves from 19.4% in FY2026 to 26.2% in FY2027, but remains below the 40% industry benchmark in the Base Case scenario.

Liquidity remains sufficient throughout the Base Case despite negative free cash flow as operating investments outpace near-term cash generation. Starting cash of €3.85m declines to a minimum of approximately €3.32m in Q2 FY2027, after which improving operating cash generation drives a recovery to €3.66m by FY2027 year-end. Free cash flow becomes sustainably positive from June 2027 and reaches approximately €90k per month in December 2027. Consequently, the business has sufficient liquidity to fund operations through sustained FCF breakeven and does not require an external funding round under the Base Case.

Operating efficiency improves during FY2027, although headcount expansion remains significant. Ending FTE increases from 95 at 2025 year-end to 129 in FY2026 and 145 in FY2027. Revenue per FTE initially declines as hiring precedes revenue realization, before recovering during FY2027 as revenue growth begins to outpace incremental hiring. SaaS Unit Economics remain strong, with FY2027 LTV/CAC of approximately 6.1x and CAC Payback of approximately 9.1 months, supporting continued investment in customer acquisition, provided retention performance is maintained.

Sensitivity analysis highlights customer acquisition and retention as the key drivers of forecast performance. Within the tested ranges, FY2027 Ending ARR ranges from approximately €15.4m to €19.5m as lead growth and conversion vary around the reference case. Profitability is particularly sensitive to the interaction between gross churn and ARPU growth, with FY2027 EBITDA margin ranging from approximately (10.0%) to +3.7%. Liquidity remains positive across the tested churn and marketing-spend sensitivities, although FY2027 pre-funding ending cash ranges materially from approximately €2.1m to €5.2m.

Overall, the Base Case indicates that the business can fund its planned growth internally through the forecast horizon, but achieving sustainable profitability depends on converting continued revenue growth into operating leverage. Management should therefore prioritize retention and conversion performance, disciplined headcount and marketing investment, and achieving and maintaining positive FCF from June 2027, while maintaining sufficient cash reserves to absorb potential downside.

Growth & Customer Performance

The Base Case forecast shows sustained top-line growth across the forecast period, with Ending ARR increasing from €10.7m at 2025 year-end to €13.6m in FY2026 and €17.5m in FY2027. This represents annual ARR growth of 26.8% in FY2026 and 29.1% in FY2027, indicating a modest acceleration in growth in FY2027. Ending MRR follows the same trajectory, increasing from approximately €0.9m to €1.5m by December 2027.

Growth is primarily driven by a combination of continued customer acquisition and increasing ARPU. The customer base expands from 850 customers at 2025 year-end to approximately 1,311 by December 2027. Lead generation and conversion therefore remain important drivers of the forecast: the Base Case assumes continued lead growth and a conversion rate that improves from approximately 4.0% in FY2026 to 4.2% in FY2027. This supports continued new customer additions throughout the forecast period.

Retention also improves over the forecast horizon. Monthly gross customer churn decreases from approximately 2.0% in FY2026 to 1.8% in FY2027, reducing the number of customers that must be replaced through new acquisition before the business can generate net customer growth. At the same time, monthly ARPU increases from approximately €1,050 at 2025 year-end to €1,115 by December 2027, providing a second source of ARR growth alongside customer expansion.

The sensitivity analysis confirms that customer acquisition performance represents a meaningful growth lever. Across the tested combinations of lead growth and conversion, FY2027 Ending ARR ranges from approximately €15.4m to €19.5m, compared with €17.5m in the Base Case. This indicates that underperformance in either lead generation or conversion can materially reduce the FY2027 revenue run-rate, while stronger execution across both drivers creates meaningful upside.

Overall, the Base Case growth profile is supported by both volume and ARPU expansion rather than a single growth driver. Management should therefore monitor lead generation, conversion and gross churn together: increasing acquisition volumes creates less long-term value if incremental customers cannot be retained, while improved retention increases the value generated from continued sales and marketing investment.

FY27: ARR €17.5m | ARR Growth 29.1% | Ending Customers 1,311 | Gross Churn 1.8%

Annual Recurring Revenue

Customer Bridge FY2027

Profitability & Operating Efficiency

Despite strong revenue growth, the business remains EBITDA-negative throughout FY2026 and most of FY2027 as headcount and operating expenses continue to expand ahead of revenue. EBITDA improves from approximately €(0.9)m in FY2026, representing a (7.4%) EBITDA margin, to €(0.4)m and a (2.9%) EBITDA margin in FY2027. Monthly EBITDA turns positive in Q4 FY2027 and reaches approximately €30k in December, while gross margin remains stable at approximately 85%. This indicates that the improvement in profitability is primarily driven by operating leverage rather than gross-margin expansion.

Headcount increases from 95 FTE at 2025 year-end to approximately 129 at FY2026 year-end and 145 at FY2027 year-end. Revenue per FTE initially declines as hiring precedes the associated revenue growth, but improves during FY2027 as revenue growth begins to outpace incremental hiring. This is reflected in the Rule of 40 improving from 19.4% in FY2026 to 26.2% in FY2027, although performance remains below the 40% benchmark.

SaaS unit economics remain strong despite the near-term EBITDA losses. FY2027 LTV/CAC is approximately 6.1x with a CAC payback period of 9.1 months, indicating attractive customer acquisition economics. However, the profitability sensitivity shows that the path to positive EBITDA remains dependent on retention and monetization: across the tested gross churn and ARPU growth ranges, FY2027 EBITDA margin varies from approximately (10.0%) to +3.7%. Management should therefore balance continued growth investment with disciplined headcount and operating expense management while protecting retention and ARPU performance.

FY27: EBITDA €(0.4)m | EBITDA Margin (2.9%) | Rule of 40 26.2% | LTV/CAC 6.1x | CAC Payback 9.1 months

Cash Flow & Liquidity

Liquidity remains sufficient throughout the Base Case despite negative free cash flow during most of the forecast period. Starting cash balance of €3.85m declines gradually as operating investments and CapEx exceed near-term cash generation, reaching a minimum of approximately €3.32m in Q2 FY2027. The cash position subsequently recovers as operating cash flow improves, resulting in €3.66m of ending cash at FY2027 year-end.

Cash flow performance improves materially during FY2027. Cash from operating activities moves from negative levels at the start of the forecast year to approximately €116k per month by December 2027, while monthly free cash flow becomes sustainably positive from June 2027 and reaches approximately €90k in December. The improvement in cash generation occurs ahead of sustained monthly EBITDA profitability, partly supported by the SaaS billing model and growth in deferred revenue. As a result, the business reaches sustained FCF breakeven without exhausting its existing cash reserves.

The Base Case therefore does not require external funding during the forecast period and remains funded through sustained FCF breakeven. However, liquidity remains sensitive to operating performance: the sensitivity analysis shows FY2027 pre-funding ending cash ranging from approximately €2.1m to €5.2m across the tested gross churn and marketing spend assumptions, compared with €3.66m in the Base Case. Management should therefore continue to monitor retention, marketing, hiring and cash generation even though the Base Case does not indicate an immediate funding requirement.

FY27: Ending Cash €3.66m | Sustained FCF Breakeven Jun-27 | External Funding Required: No
Dec-27: CFO €116k | FCF €90k

Scenario & Sensitivity Analysis

Scenario analysis illustrates the combined impact of changes in the key commercial, cost and headcount assumptions consisting of 24 drivers. The Base Case represents the central operating plan, while the Best and Worst Cases assess the effect of stronger or weaker customer acquisition, retention, ARPU development and cost performance. The resulting range in growth, profitability and liquidity provides management with a view of how the business performs under materially different operating environments.

The sensitivity analysis isolates the impact of individual operating drivers around the reference case. Growth is particularly responsive to lead growth and conversion: within the tested ranges, FY2027 Ending ARR varies from approximately €15.4m to €19.5m, compared with €17.5m in the Base Case. This represents approximately €2.1m downside and €2.0m upside relative to the Base Case and highlights the importance of maintaining both sufficient lead generation and conversion efficiency.

Profitability and liquidity are particularly sensitive to customer retention. Across the tested combinations of gross churn and ARPU growth, FY2027 EBITDA margin ranges from approximately (10.0%) to +3.7%, compared with (2.9%) in the Base Case. Similarly, varying gross churn and marketing spend results in FY2027 pre-funding ending cash ranging from approximately €2.1m to €5.2m, versus €3.66m in the Base Case. The analysis therefore indicates that retention performance is a key link between growth, profitability and liquidity, while management can partially mitigate liquidity pressure by adjusting marketing spend.

Key Risks & Management Actions

The Base Case supports continued growth without external funding, but the forecast remains dependent on successful execution across customer acquisition, retention and operating cost management. Based on the forecast and sensitivity analysis, the following areas require particular management attention:

Key Risk	Model Evidence	Management Action
Customer Retention	Gross churn of 1.8% in FY2027 remains a key driver of profitability and liquidity. Higher churn materially reduces EBITDA margin and ending cash.	Monitor churn and retention trends by customer segment and investigate early signs of deterioration. Prioritize retention initiatives where customer lifetime value justifies the investment.
Acquisition Performance	FY2027 Ending ARR ranges from approximately €15.4m to €19.5m across the tested lead growth and conversion sensitivities.	Track lead generation and conversion against plan and adjust acquisition activity where funnel performance deviates materially from forecast.
Operating Leverage	FTE increases to approximately 145 by FY2027 year-end while FY2027 EBITDA margin remains negative at (2.9%).	Link incremental hiring to revenue and workload requirements and review hiring plans if revenue growth underperforms expectations.
Path to Positive Cash Flow	Sustained FCF breakeven is not reached until Jun-27 and cash declines to approximately €3.32m before recovering.	Monitor monthly FCF and cash against forecast, with particular attention to the timing of the expected FY2027 cash-flow improvement.
Liquidity Downside	Pre-funding FY2027 ending cash ranges from approximately €2.1m to €5.2m in the liquidity sensitivity analysis, while the Worst Case requires external funding.	Maintain sufficient cash headroom and reassess marketing spend, hiring and funding requirements if operating performance falls materially below Base Case.

Management Conclusion

The Base Case provides sufficient liquidity to execute the current growth plan and reach sustained positive FCF without external funding. Management attention should therefore focus primarily on protecting retention and acquisition performance while ensuring that headcount and marketing investment translate into the operating leverage assumed in FY2027. Early identification of underperformance allows management to adjust spending or, if necessary, secure external funding before liquidity comes under pressure.
